Test No. 20-5620: **Shooting Reconstruction - Angle Determination**

Each sample set contained a wooden box that consisted of one entrance hole, one exit hole and a "TOP" label to distinguish the orientation of the box. In addition, one "A" label and one "I" label were placed on opposite sides of the box to assist participants when reporting the entrance/exit holes and direction of travel. Participants were requested to determine the entrance hole, the direction of travel and calculate the angles. The front of the box containing the "A" label was associated with the entrance hole and the direction of travel was right to left, downward. The angles as measured during production are described below.

PRODUCTION: The sample was placed onto a fixed angle set up (jig). A 9mm CZ Evo Scorpion firearm was affixed above the jig and a digital angle finder was placed on the jig to confirm the angle to be shot.

The Horizontal (Azimuth) angle was measured at 4° from perpendicular, 86° right to left or 94° left to right. The Vertical angle was measured downward at 29° or 61° and 151° upward.

SAMPLE SET ASSEMBLY: After each sample was shot, it was securely placed in a sample pack box. This process was repeated until all of the desired samples were produced.

VERIFICATION: All three predistribution laboratories reported Horizontal and Vertical angles within +/-5° from the expected responses.
